RAPT THERAPEUTICS

Blood And Skin Biomarkers From A First-in-human Study Of RPT193 - An Oral CCR4 Antagonist For The Treatment Of Atopic Dermatitis

Paul D. Kassner, Ph.D.

7th Annual Biomarker and Companion Diagnostics Conference

June 17, 2022

RPT193: Oral CCR4 Antagonist for Inflammatory Diseases

- RPT193 is a highly potent and selective once-daily oral CCR4 antagonist that targets inflammation more specifically than JAK inhibitors and acts upstream of many injectables
- Phase 1b trial demonstrated clear benefit in patients with moderate-to-severe AD, with favorable safety and tolerability
- No laboratory safety monitoring or black box warning expected
- Next steps: Phase 2b trial in AD and a Phase 2a trial in asthma

PERSPECTIVES

OPINION

Overcoming hurdles in developing successful drugs targeting chemokine receptors

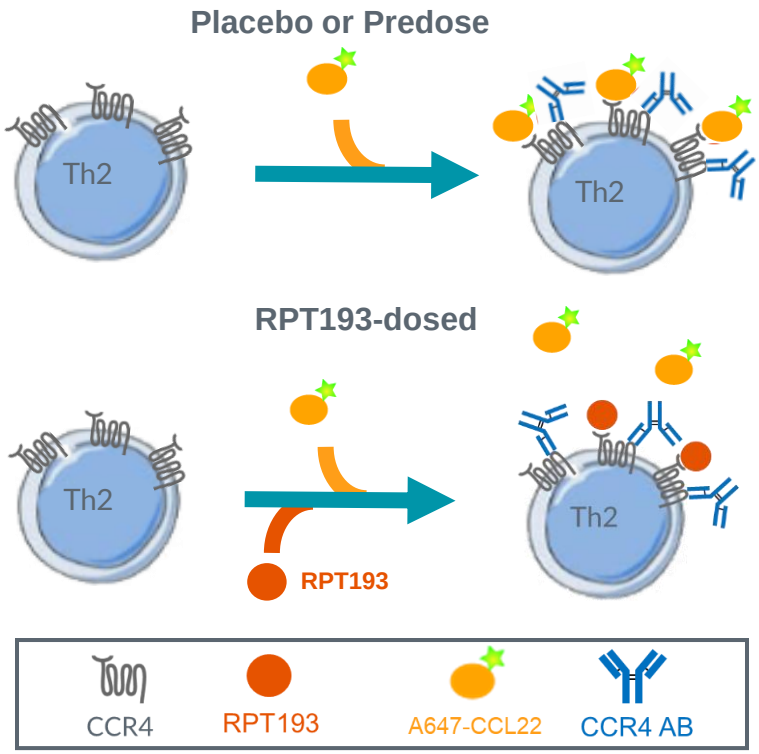
Thomas J. Schall and Amanda E. I. Proudfoot

Key conclusion:

For clinical efficacy, a compound must be at IC_{90} concentration at trough levels.

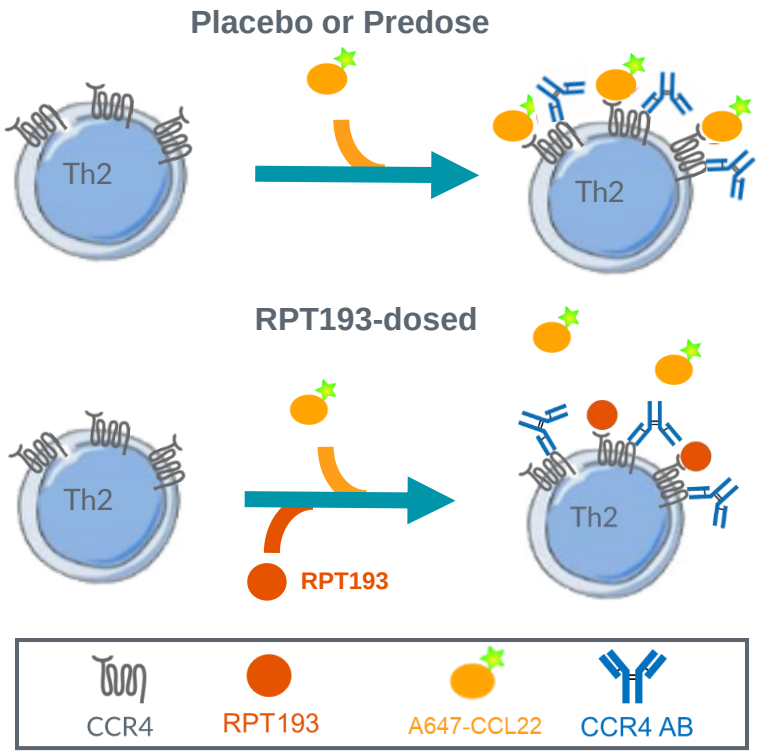
RAPT THERAPEUTICS

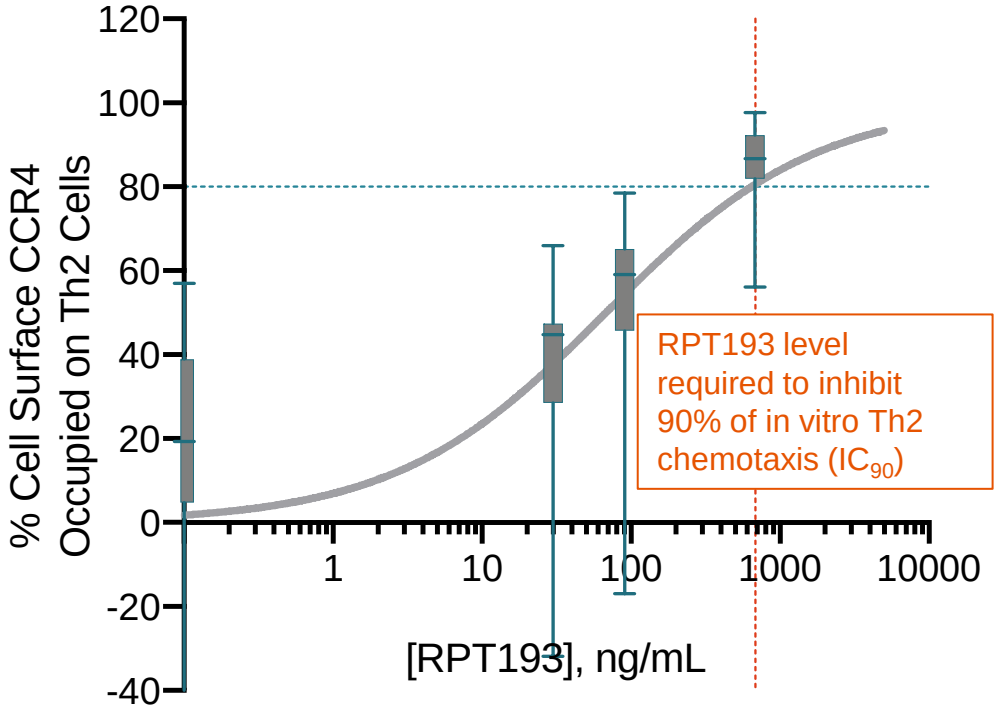
Whole Blood Assay Developed To Measure CCR4 Surface Receptor Occupancy On Human Th2 Cells



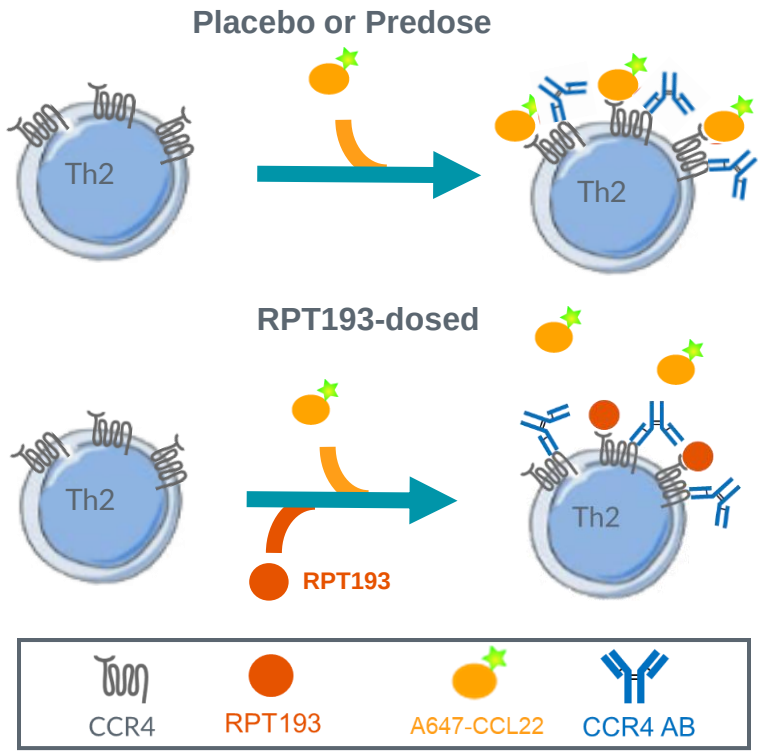
- Staining performed in fresh whole blood
- Th2 cells defined as: $CD4^{+}CD45RO^{+}CXCR3^{-}CCR6^{-}$
- A647-CCL22 binding normalized to cell surface CCR4 levels to determine surface receptor occupancy (sRO)
- Initial development in healthy blood; confirmed in blood of atopic dermatitis patients
- Intra/inter-assay reproducibility was good (CV <15%)

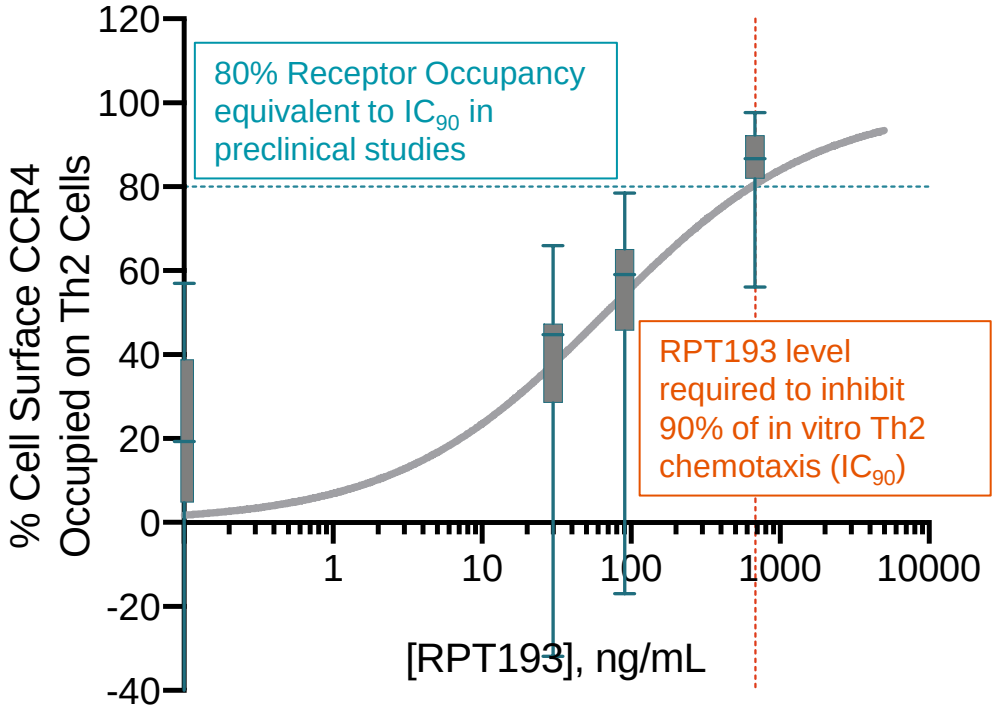
Whole Blood Assay Developed To Measure CCR4 Receptor Occupancy On Human Th2 Cells



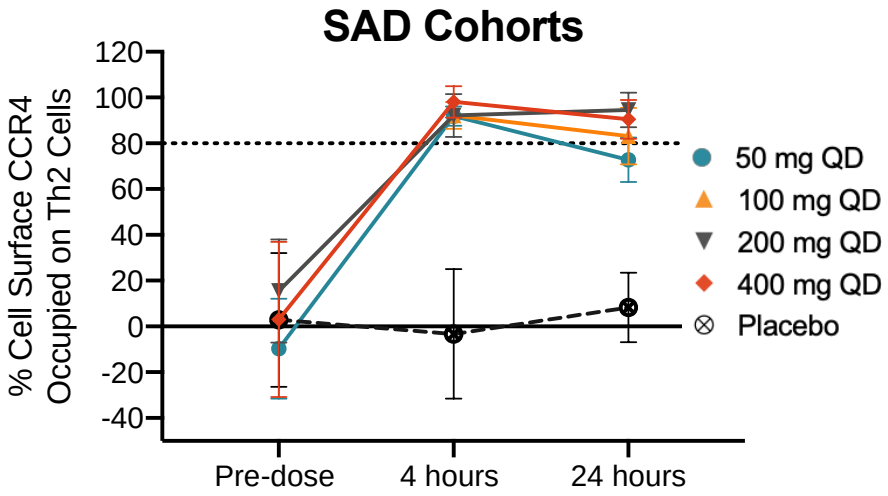


Whole Blood Assay Developed To Measure CCR4 Receptor Occupancy On Human Th2 Cells





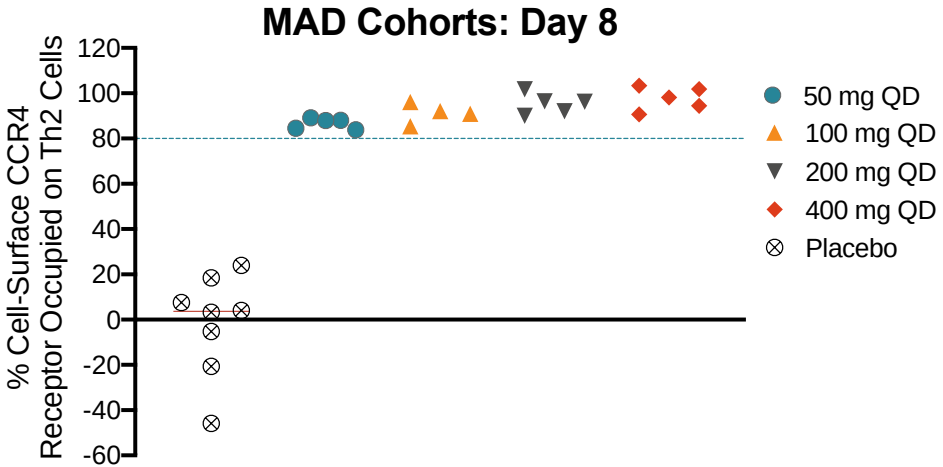
RPT193 Demonstrated Target sRO With Once Daily Dosing in Healthy Volunteers

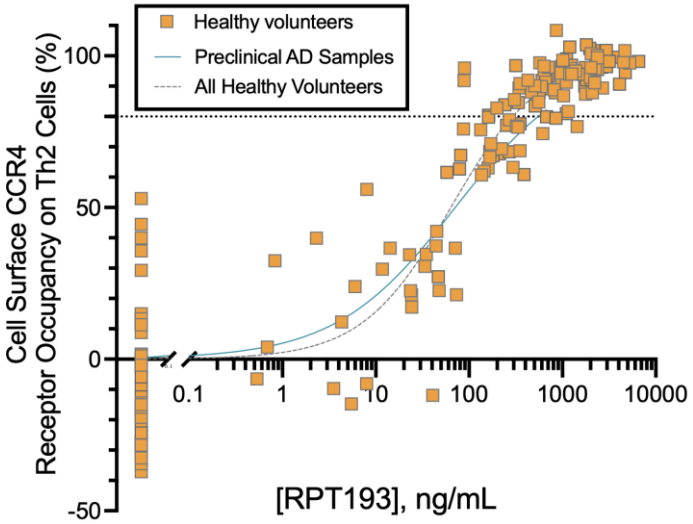


- CCR4 sRO greater than 80% was achieved by 4h post-dose in each cohort
- At 24 hour “trough”, sRO dropped below 80% target for 50 mg and 100 mg cohorts

- RPT193 has ~25-hour half-life
- Expect ~2-fold accumulation with repeated dosing

RPT193 Demonstrated Target sRO With Once Daily Dosing in Healthy Volunteers





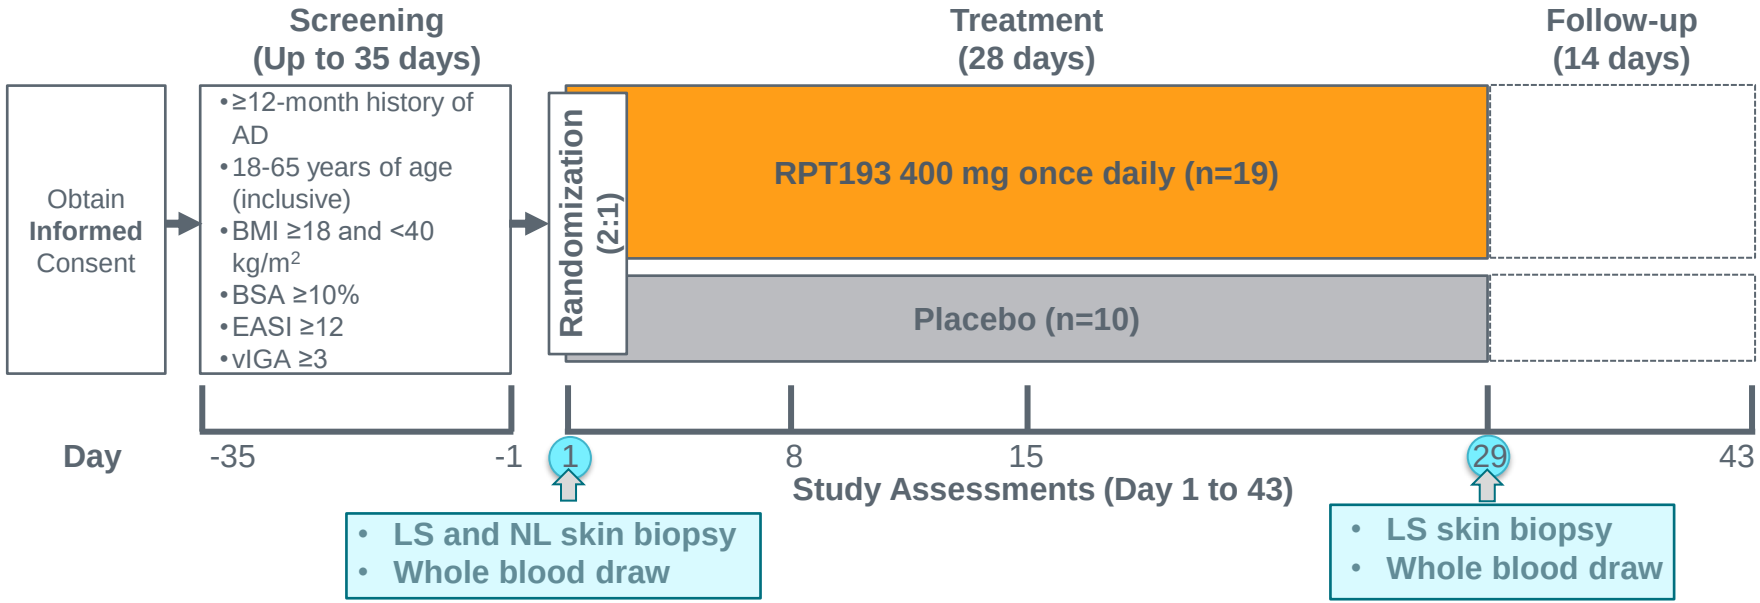
- All RPT193 dosed subjects reached the 80% target for sRO after 7 days of dosing
- RPT193 demonstrates good PK-PD relationship

RAPT THERAPEUTICS

RAPT THERAPEUTICS

PK, PD and Safety Data Supported Progression Into Atopic Dermatitis Patients at 400 mg Once Daily

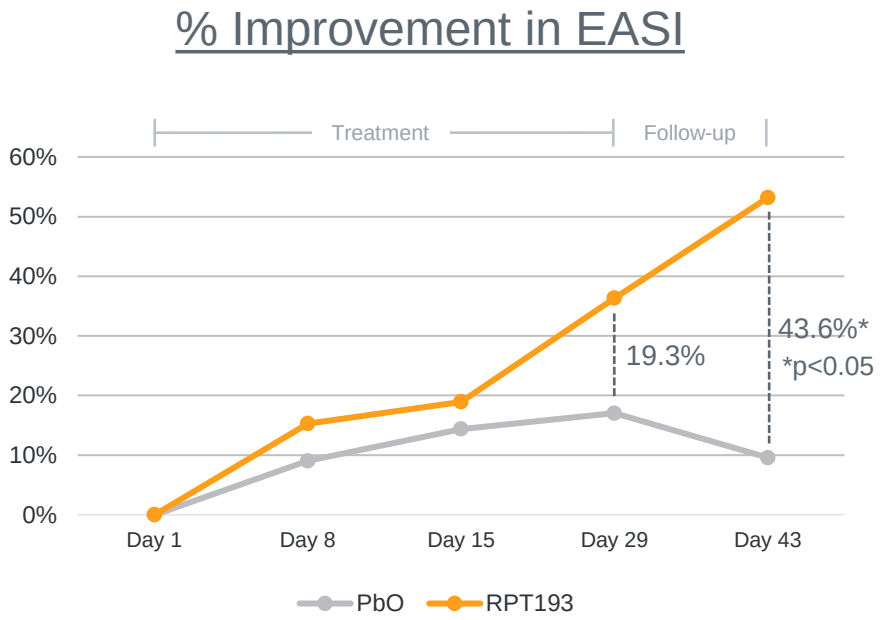
Phase 1b Trial Explored RPT193 Activity in Subjects with Moderate-to-Severe Atopic Dermatitis



- Double-blind, randomized, monotherapy study
- Primary and secondary endpoints were safety and PK
  - Trial was not powered for clinical endpoints (EASI and SCORAD were exploratory endpoints)
- In addition to skin biopsies, plasma and whole-blood biomarker assessments were performed

RPT193 Exhibits Improvement in EASI At Day 29 With Further Improvement Through Day 43

EASI = Eczema Area and Severity Index



- RPT193 demonstrated improvement compared to Placebo in multiple measures for disease severity (EASI, EASI-75, vIGA 0/1 and SCORAD)
- Once-daily, oral RPT193 was generally well tolerated after 28 days of dosing

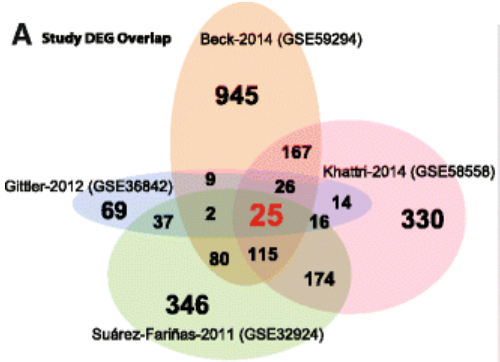
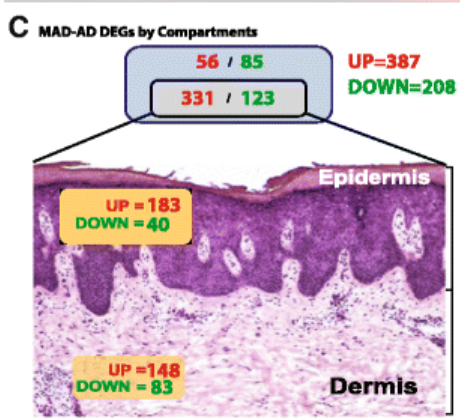
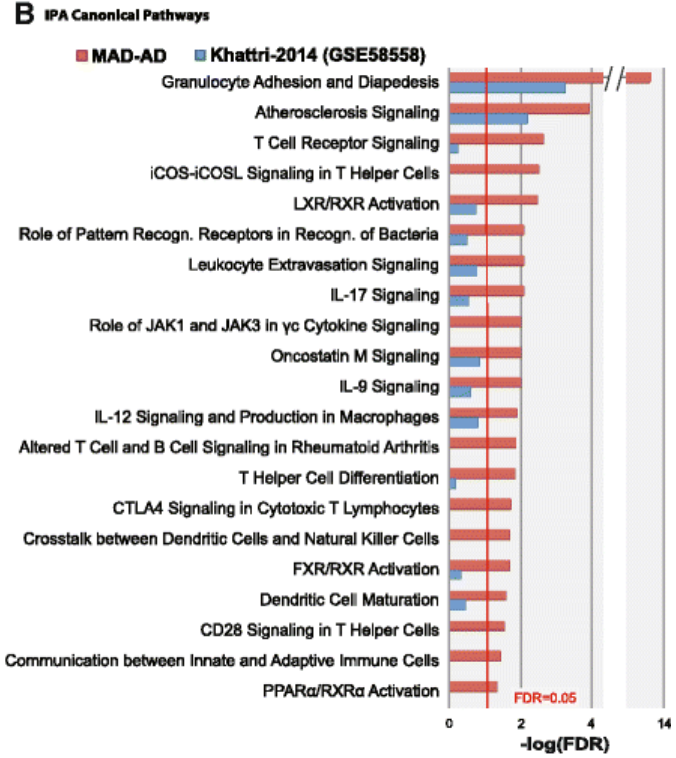
Skin Biopsy RNA-seq Transcriptomic Analysis

The following slides and analysis of RAPT data are in collaboration with Dr. Emma Guttman-Yassky

Meta-analysis-derived AD Transcriptome (MADAD)







- 4 studies and 97 samples
- Uniform pre-processing pipeline
- Random effects model
- |FCH| ≥ 2, FDR ≤ 0.05
- Identified a set of 595 DEGs (387 up- and 208 downregulated)

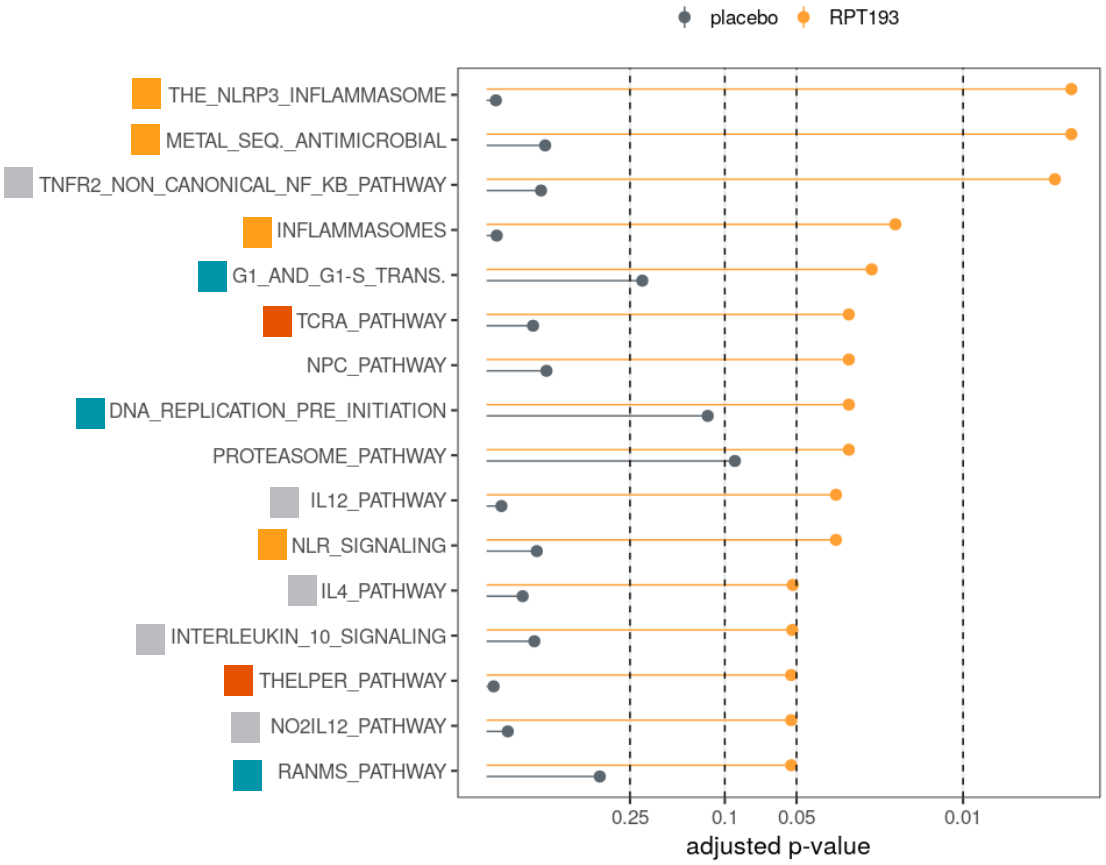
Gene Set Enrichment Analysis Indicates Multiple Pathways Are Changed on RPT193 Treatment



- Anti-microbial/ NLR/ Inflammasome signatures
- Cytokine pathway signatures
- Proliferation signatures
- T cell signatures

RAPT THERAPEUTICS

Summary

- RAPT is developing an oral, selective and potent CCR4 small molecule antagonist for the treatment of AD and other Th2-driven diseases
- RPT193 has demonstrated clinical efficacy in a small, randomized Phase 1b study in moderate to severe atopic dermatitis
- Once daily dosing of RPT193 results in excellent surface CCR4 receptor occupancy at trough concentrations
- Cell surface CCR4 is decreased following RPT193 treatment
- RPT193 treatment results in improved MADAD transcriptome, a gene signature for key pathways of AD that is being used to evaluate therapeutic responses
- RPT193 is currently being tested in a Phase 2b study for AD and will be tested in a Phase 2 study in asthma
